Workshop Project Info

Find demo project:
https://jlord.us/forkngo

GitHub repository for the project:
http://www.github.com/jlord/hello

Fork the hello repository & clone your fork
- Fork the project from http://www.github.com/jlord/hello.
- GitHub will create a copy of the "hello" project into your GitHub account
- Clone your copy of the "hello" project
  - Copy the ssh url within GitHub

  - Start the command git clone – then paste in the ssh url
    - Example:

```
git clone git@github.com:your_user_name/hello.git
```

Explore your local repository
- Run git remote to see your remote alias (the site where you'll will push back to & pull from)

```
git remote -v
```

- Run git log to see previous commits
- Run git branch to see branch info

```
git branch
```

Make edits & commit
- To edit the text, open up index.html
  - Nano index.html
    - If you open up an empty document, make sure you're in the correct directory.
- Preview your changes
- When you want to make a commit, save to the document, run git add & git commit -m.

Push back to your GitHub account
- Run the git push command.

```
git push origin gh-pages
```
  - In most other cases, you'll actually push to master (i.e. git push origin master)
- Navigate to your GH pages
  - You'll find your site at a URL: https://*github_user_name*.github.io/hello

Make more edits and repeat process!
- To change how the page looks, edit css/style2.css
- Remember to add & commit & push, when you see fit.
